Flexible Deep Archive & Data Migration

A Simple Backup and Deep Archive Application

Using a sledgehammer to crack a nut may be good exercise, and fun to a degree, but many of the HSM software packages out there provide functionality that most organisations do not nor will not use.

move2 is a simple yet surprisingly powerful deep archive application that uses the MatrixStore API to quickly copy data between your various storage platforms and your MatrixStore archive. move2 watches selected folders on any storage and moves new or changed content to the selected MatrixStore vault. It is also possible to move content from those MatrixStore vaults to a 3rd party deep archive platform such as Flashnet from SGL, Masstech or Xendata.

Moving content to deep archive platforms can be performed manually using Object Matrix graphical interfaces DropSpot or move2, automatically by setting policies in the move2 application (based on age of data etc) or via 3rd party applications using the move2 service API. The latter allows content archived by one application to be restored by any application using the move2 service API.

If you require the ability to move content between multiple tiers of tightly integrated file based workflows please do not hesitate to get in touch.

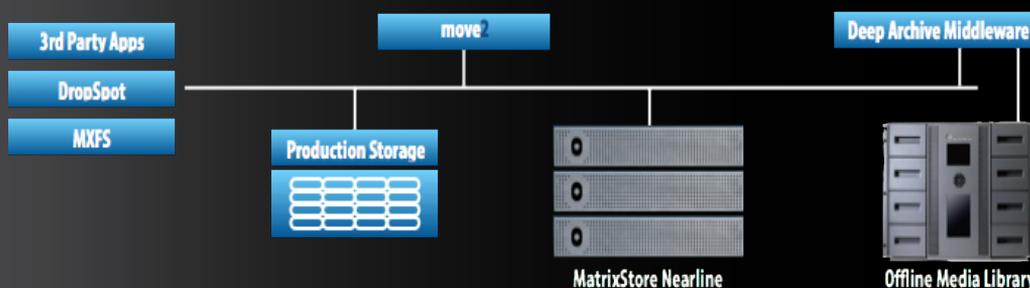

move2 Benefits

- Effortlessly move data between tiers of storage
- Frees up your staff from mundane and error prone tasks
- Can be driven by 3rd party applications such as InterConnect
- Future proof restore without using the application that archived the content
- Policy based data management
- Schedule when the data gets moved
- Non-proprietary formats supported
- Metadata exported to deep archive as side car file
- Integrated with 3rd party middleware solutions from SGL, Xendata, Masstech and Sony ODA

move2 Product Highlights

- **Guaranteed Data Authenticity:** Using the MatrixStore APIs ensures the data stored is guaranteed to be authentic.
- **Version Management:** Choose to over-write existing versions of content or write a new version of the changed file.
- **Deletion:** Choose to leave content in the MatrixStore vault that has been deleted from the folder being watched.
- **Platforms:** The Windows operating system is the supported platform in version 1.0 of move2.
- **Management Console:** lets you specify vaults to watch, monitor jobs in progress & view historical jobs.
- **Integrated:** Use DropSpot or 3rd party applications to search for and browse files that have been stored using move2.
- **File System Support:** Optionally open the content directly using MatrixStore file system application MXFS.
- **Non-Proprietary:** Archives your content using industry standard archive formats (LTFS or TAR)
